package - command line interface I am creating a custom Python package and I would
like to have a command line interface. I would like to create a module in my package
that exposes the interface and some of the modules used within the package. What I
tried: Python package `setup.py --help` would list the possible commands, but no matter
what command I use, I get: usage: package.py [-h] command [ARGS] -h, --help show
this help message and exit command [ARGS] command1 command2 command3
command1 command2 command3 The output is different if I use `--help-commands`
instead. Python package `setup.py --commands` usage: package.py [-h] commands
[ARGS] -h, --help show this help message and exit commands [ARGS] command1
command2 command3 command1 command2 command3 PEP 249 I read PEP 249, and
that's basically what I did. I added the following code: `from setuptools import setup`
`name = "package" version = "1.0.0" setup(name=name, version=version, entry_points={`
`'console_scripts': ['command1 = mypackage.command1:main'] }, zip_safe=False,`
`package_data={`

Reinstall if unsuccessful. Microsoft Sidewinder mouse M. Mar 23, 2019 [Webrec.cab](#)
