Milftoon Lemonade 6.This invention relates generally to rotorcraft turbine engines, and more particularly, to a full-flow, or external, fan-to-rotor duct geometry. Many gas turbine engines are employed in environments where the fans are subjected to continuous full-time dust ingestion. Excessive dust ingestion can cause damage to fans by blocking orifices. Since dust ingestion is a problem for many fans, it is important to design the flow path for debris into the fan as clean as possible. Traditionally, the flow path for the fan to rotor interface was designed such that the fan bypass air traveled directly through the fan to the rotor. In order to avoid the high-pressure region created by the fan, fans were designed with relatively large sizes to create a slow, axial velocity fan flow so that the fan bypass air could be vented radially through the high-pressure region. However, fan inlet radii were too large for traditional fan designs, which resulted in a certain amount of fan bypass air being forced radially back toward the rotor via the circumferential ramp or “slip” flow paths. In order to minimize the ramp or “slip” flow, conventional fans were designed with an inlet radius that was small enough to generate a significant fan bypass pressure drop. However, this reduced the amount of fan bypass air that flowed into the fan and hence the volume of airflow generated by the fan. Conventional fan designs are illustrated in FIGS. 1 and 2. The fan inlet boundary layer thickness and the local velocity tangent, which is a function of the pressure difference, have different coefficients of variation. In conventional fans, the flow must be designed to be as radial as possible due to the low pressure coefficient, which is a function of fan inlet radius, since a lower pressure coefficient corresponds to a smaller inlet radius. Therefore, a smaller inlet radius generally results in an increased local velocity tangent. However, the increase in local velocity tangent creates a transition region at the fan rotor interface in which the tangential velocity gradient is high. Such a high tangential velocity gradient may create the undesirable impact of the blade-tip to the
