In general, portable information processing apparatus are capable of transmitting and receiving information via wireless communication, for example, through an information processing terminal or a wireless communication base station which is connected to a network. In order to enhance data communication capacity, the data communication capacity (data communication speed) of wireless communication lines such as wireless local area network (LAN) and wireless metropolitan area network (WMAN) has been enhanced, and as a result, the throughput of wireless communication is enhanced. In recent years, an MIMO (Multiple-Input Multiple-Output) technique (for example, see Patent Documents 1 to 7) which uses a plurality of antennas and an OFDM (Orthogonal Frequency Division Multiplexing) technique (for example, see Non-Patent Document 1) are being considered for enhancing the data communication capacity of wireless communication. The MIMO technique is an effective technique capable of enhancing the data communication capacity at a stage of short-distance transmission and in a line of predetermined transmission distance, for example, within a wireless LAN using an
